

“ MOSAICO” PROJECT

The project entitled "**MOSAICO: Models, products and services to make the lives of "fragile" people in communities spread across the territory socially active and inclusive**", was admitted to financing pursuant to the Innovation Agreement Ministerial Decree 24/5/2017 and Funded as part of the Union's response to the COVID-19 pandemic.

The project aims to create innovative software products capable of supporting the application of a personalized service model aimed at improving the quality of life of the "fragile" elderly population, with a reference target of those who live in small communities distributed across the territory.

The different software modules of the platform, at a functional level, will guide the operator (doctor and/or social worker) in the analysis of the characteristics of the person from a physical-cognitive point of view and of his social context.

From a technical point of view, a web-based platform will be developed which will be usable on all the most popular types of devices (PC, tablet, smartphone, smart TV), with distinct access based on the specific user. The data will then be stored on the cloud and maximum IT security will be guaranteed. The various modules of the platform will be available to the various actors (specialists, general practitioners, social workers, coordinators, elderly users, caregivers, administrators) based on their role.

The platform does not intend to be a telemedicine system but will have to interact with it when present, in order to extract data that can be used in the monitoring phase of the user's conditions.
